A,Description: catalyzes the reduction of the heme-thiolate-dependent monooxygenases, A,Note: expression induced by fungal elicitor-treatment or or UV-irradiation C,Superfamily: NADPH-ferithemoprotein reductase; flavodoxin homology; NADPH-ferrihemo C;Keywords: flavoprotein; NADPP; oxidoreductase F;74-680,Domain: NADPH-ferrihemoprotein reductase homology <FEH>
                                                                                                                                                                  parsley
NADPH-ferrihemoprotein reductase (EC 1.6.2.4) - parsley
N.Alternate names: NADPH cytochrome P450 reductase
C.Species: Petroselinum crispum (parsley)
C.Species: Petroselinum crispum (parsley)
C.Date: 20.5ep-1999 #text_change 03-Jun-2002
C.Accession: T14903
R.Koopmann, E.; Hahlbrock, K.
Proc. Natl. Acad. Sci. U.S.A. 94, 14954-14959, 1997
A.Title: Differentially regulated NADPH:cytochrome P450 oxidoreductases in parsl
A.Reference number: Z18258; MUID:98070859; PMID:9405720
A.Reternce number: L18258; MUID:98070859; PMID:9405720
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: mRNA
A.Residues: 1-681 <KOO>

"Pivotal role of water in the mechanism of P450BM-3.";
Biochemistry 40:13456-13465(2001).
-!-FUNCTION: FUNCTIONS AS A FATTY ACID MONOOXYGENASE. CATALYSES
HYDROXYLATION OF MEDIUM AND LONG-CHAIN FATTY ACIDS AT OMEGA-1,
OMEGA-2 AND OMEGA-3 POSITIONS, WITH OPTIMUM CHAIN LENGTHS OF 14-16
CARBONS (LAURIC, MYRISTIC, AND PALMITIC ACIDS). THE REDUCTASE
DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME
                                                                                               oxidized flavoprotein + H(2)0.
COFACTOR: FAD AND FNN.
SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE CYTOCHROME
P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                       PRINTS; PR00371; FPNCR.

TO CYTOCHON: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NATIO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.

-1- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -i- SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM. ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
-i- SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGOUS WITH FERREDOXIN NADP+ REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE

-I. FUNCTION: THIS ENZYME IS EQUIRED FOR ELECTRON TRANSFER FROM NATA OCTYCCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1- COFACTOR: FAD AND FMN.
-1- SUBCELULAR LOCATION: ENDOPLASMIC RETICULUM, ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
-1- SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGOUS WITH FERREDOXIN NADPH REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Haniu M., Iyanagi T., Miller P., Lee T.D., Shively J.E.;
Complete amino acid sequence of NADPH-cytochrome P-450 reductase
from porcine hepatic microsomes.";

ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
-i- SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGOUS WITH FERREDOXIN NADP+ REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       region.",
J. Biol. Chem. 257:5929-5938(1982).
-I- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NATIO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Black S.D., Coon M.J.; "Structural features of liver microsomal NADPH-cytochrome P-450 reductase. -i- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NATO CYTOCHROWE 8450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEM OXYGENASE AND CYTOCHROME B5.
-i- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome - NADP(+) + 2
                                    9/9
                                                                                                                                                                                                                                                                                                                                                                                                                                           Cavia porcellus (Guinea pig).

"Structural comparison between the trout and mammalian hydrophilic actuctural comparison between the trout and mammalian hydrophilic domain of NADPH-cytochrome P-450 reductase.";
J. Chromatogr. A 397:123-136(1987).
-!- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NA TO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
-!- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome - NADP(+) + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             COFACTOR: FAD AND FWN.
SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM. ANCHORED TO THE
EN MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
SIMILARITY: THE FWN-BINDING DOMAIN IS RELATED TO BACTERIAL
FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGOUS WITH FERREDOXIN
